

**In the future natural resources such as oil and coal will be used up. How can we save on resources? What alternative forms of energy are available?**

Natural resources are quite vital for our existence, but overuse of them causes shortage of these priceless resources which has become a heated debate these days. The amounts of natural resources are limited, whilst the consumption and demand for them are dramatically increased.

First of all, the governments are in charge of raising awareness of the public about this phenomenon and also providing feasible solutions. For instance, they are supposed to encourage people to use all means of ~~the~~ public transport instead of their private vehicles to save fossil fuels. Secondly, it is people's responsibility to make every effort to reduce decline the use of natural energies such as oil and coal which are running out. The more we waste minerals and water resources, the less they will remain for the future generation.

Besides, the generation of electricity also has become a major issue. It would be difficult to control the usage rate of electricity because our modern lifestyle is extremely dependent on/related to it. It is, however, essential to save it by either fewer-less electrical equipment and gadget consumption or turning off extra lights.

On the other hand, we must find alternative sources of energy such as wind power, solar power and hydro-electrical energy and replace ~~them-fossil fuels with~~ by the alternative energies other-one. Not only will we save natural resources, it also leads us to reduce ~~amounts-of~~ air pollution. Consequently, we will save our world from the impact of many concerns like global warming, emission of greenhouse gasses and damaging the ozone layer.

In conclusion, by substituting the renewable power for natural energy which is finite can keep nature alive and prevent our environment from degeneration/being damaged.
