

Some people think that money spent on space exploration is a waste and could be better used to fund other urgent problems in society.

To what extent do you agree?

It is true that there are many issues on the Earth to deal with ~~peruse~~, and it would be better ~~off~~ to investigate ~~on~~ the resolution of these to live longer here rather than spending much money on the space to invent the unseen universe which may be useless as well.

On the one hand, we are living on Earth with the rise of population at an alarming rate, and also the resources are finishing every day ~~everyday~~ being a great threat to our future life on the Earth. The more people live, the more ~~much~~ food, drinking water, non-polluted air is needed. Therefore, it seems any investigation to improve ~~the~~ life should be focused just on the place of living (*living place?*), not very far in an unknown world. If we conduct any survey to produce more qualified food with the aid of modern technologies in a short time, we would pave the way for having to have a better life for the next generation and it would be feasible to live longer on Earth despite ~~of~~ the planet's issues in recent decades. For instance, these days many people are suffering from new incurable diseases triggered by dangerous viruses such as Zika transmitting the virus via mosquitos. If we do not spend the needed money to develop ~~devise~~ the vaccines and drugs to tackle those challenges with, the people would die in a large scale in near future.

On the other hand, in space we might find the possibility of living on other planets which would be definitely precious in future, so it is vital to define some budget in this field. If one day ~~the~~ humans could not live any more on Earth, ~~we the people~~ would have the opportunity to travel to space to live on other places such as Mars or the Moon, consequently the world would not be ended. For example, ~~the~~ water is running out on Earth because ~~since~~ of climate change, if we find water anywhere else we hope to be able to live there too. In addition, by exploring the space and other planets, we

might discover some valuable resources, and also find out how to exploit ~~adopt~~ them here for subsequent enhancement.

In conclusion, although we have many undeniable considerations to cope with ~~which~~ most of them most of which cause the growth of expenditure, exploring the space would be beneficial to the current world even if we had ~~have~~ to stay on Earth forever.
