

==Government should spend money on railways rather than roads.to what extent extend do you agree or disagree with this statement?

These days a great number of people believe that the amount of money which is ~~spending~~ spent on railways should be increased instead of more investment for roadway systems. ~~In from~~ in my point of view railways have a lot of advantages, but the benefits of roadway systems outweigh ~~outway~~ them.

The Roadway system is suitable for short distances unlike the railway system which only suits ~~for~~ long distance transporting. Using roads for conveying goods is cheaper and more economical al than railways and also they can provide door to door or warehouse to warehouse services; this reduces cartage, loading and unloading expenses besides the railways which are limited to some restricted stations.

The capital outlay for the roadway system is much lower than the railways. The cost of constructing, operating and maintaining roads is cheaper than railway transportation. overall, this leads to a decline in the budget which should be ~~spend~~ spent on transport ~~system~~. Statistics ~~has~~ have indicated that the expenditure of building roads is almost half of the amount of money which should be allocated ed for establishing railways with the same condition.

Although, there are a lot of profits for the roadway system, the drawbacks are undeniable. Railways are more appropriate as well as convenient for bulky and heavy goods over long distances. Some trains are specialized for carrying products which cannot be transported ed by roadways or airways. Railways are least affected by weather conditions compared to other methods of transport so they are almost always ~~every time~~ available. The most important strength ~~strong point~~ about railways is their safety. There ~~are is~~ a few accidents by means of them in contrast to other modes ~~terms~~ of transportation such as roadways.

Generally, there ~~are is~~ some advantages about every transport system, so all of them are functional but these days according to our newest knowledges and technologies, in my opinion, the roadway system is perhaps the most functional one. Roads are not only very convenient for different uses, but also cheap to build in comparison to other systems.
