

One the consequences of improved medical care are that people are living longer and life expectancy is increasing.

Do you think the advantages of this development outweigh the disadvantages?

As scientists make new discoveries and inventions (discover and invent new things) in advantage of medicine and human health, the human life span (span of one's life) tends to grow. And consequently, the world starts facing conclusions with different impacts.

To begin with, the more-lager population and the longer period of lives are-simultaneously growing, the higher the expenditure of earth's food storage. Moreover, at some point, because of the reproduction breeding range tied to people's age, the population's growth process will have-experienced a slowing down-which -Which results into having fewer young people in the-society. Thus, the innovation in the world shall will hit somehow a plate-plateau that to compensate it could take a significant amount of effort.

Having said all the aforementioned, living longer gives the ability to have more experiences in life. To illustrate it, being able to see more of this world and having more interactions on spiritual levels is a gift that not everyone has a chance to appreciate. To be around your loved ones as much as possible is not only and expectation from life but also a pleasure not everyone is blessed with considering the new diseases coming out/emerge every day. Also, it's a plausible fact that there are a few people obliged by higher powers and considerable valuable intentions that the world could benefit from these people living as long as possible.

I personally assume that the world, followed by humankind, evolves on a trend which is neither perfect nor disastrous. Thus, there will be no other ways but, to become accustomed to it. We should be prepared for every eventuality.
