

Do you agree or disagree with the following statement? People learn things better from those at their level- such as fellow students or co-workers than from those at a higher level, such as teachers or supervisors. Use specific reason and examples to support your answer.

In general in the education-based era we live in, when everyone should learn many things during their life span~~life's span~~, it is safe for one to assume that the difference between the teachers' and learners' level is a key factor in learning procedure; however from which level the people can learn efficiently has been a rather controversial issue among many in this regard. There is a rather prevalent idea regarding this issue which states that, people can learn better from their own level than ~~others~~those with higher levels. I personally concur with this idea. The corroboration for this issue will be elaborated in what follows by focusing on two reasons.

One imperative reason coming to my mind at first is that, similar-level people usually have similar problems and abilities, so people can teach better the others in their levels. For example, in special sports like the soccer, students can learn better from their teachers when ~~their teacher~~they have ~~has~~ abilities like the students, because most of the techniques they learn depends on the body power, running speed, and body size ~~, etc.,~~ which are ~~is~~-almost similar between the same level people.

In addition to the similarity of the ability, the language of the teaching has a profound effect on the quality of teaching. Young people usually use simple structures for languages in speaking and writing with simple words, while the older and educated people use the complicated language structure in speaking and writing, also the social level has an effect on the language structure, for example professors are speak differently from the workers; so similarity of the age and social level ~~have~~has a profound effect on learning from each other especially in teaching at school.

To put in a nutshell, it seems that people learn better from others similar to their level than others, because of the similarity of the ability and problem they face and the structure of the language they are using. It proposed that teachers in the classes consider that phenomena and decreases the difference between them and students to have an efficient class.
