

In this day and age the population is growing beyond our wildest imagination, so providing houses for this ~~much-bid a~~ crowd is a matter of concern. There are two major solutions for this issue which this essay is going to focus on ~~them~~. The ~~more-larger~~ the population, the more homes are needed.

Many people opine that the price of ~~a~~ land in ~~the~~ countryside is lower than ~~that~~ in the city center. Therefore, ~~e~~, one solution is to build houses in the countryside. As mentioned before, ~~the~~ governments can build ~~adequate too-much~~ houses there due to the low-priced land. Although having some disadvantages, this can reduce the price of an apartment around the cities.

On the other hand, the advocates of the environment assume that this is a highly-destructive action to build houses in the countryside because they believe that wherever the human beings enter, its environment will be ~~depletedadversely~~ ~~affected~~. Additionally, they say that governments should not destroy the environment just because of ~~the~~ population growth.

However, in this way the traffic congestion in the city center will grow due to the commute that happens every day. ~~Trying to~~ Overcom~~e~~~~ing~~ this problem, municipal authorities in the megalopolises ~~have~~ decid~~e~~d to construct high-rise buildings in the city centers so that ~~the-staff~~~~employees/commuters~~ can get to work without any redundant commute. Also, this leads to ~~rising-raising~~ work efficiency in some cases.

From an overall perspective, it is incumbent on governments to provide enough houses for their citizens regardless ~~of~~ their population. However, they are expected to adopt some measures with the least possible damage ~~on-to~~ the environment.
