In developing countries, children in rural communities have less access to education. Some people believe that the problem can be solved by providing more schools and teachers, while others think that the problem can be solved by providing computers and internet access.

Discuss both views and give your own opinion.

One of the important problems in developing countries is lack of educational facilities in rustic societies for children. Some argue that for solving this problem authorities should supply more schools and teachers for students, but others think that providing new technology such as the internet and computers ~~are~~ is useful for them. In my opinion, both of the solutions are essential for students in these areas.

On the one hand, the number of schools in rural areas is not according/proportional/proportionate to the number of villages and this is first problem for students. Some children have to go long distances for going to a school which is in the other villages. Therefore, their parents avoid sending their children there as such schools are not nearby~~this is not to exist in their habitat~~ and also it is costly~~capital-intensive~~ for them. In addition, the teachers who go to rural communities are ~~less~~ few and they prefer to be in city rather than far-flung villages due to many reasons such as low salary, lack of a public transport system, long distance and much more besides. Although governments send teachers to these places, they are often junior~~'s~~ teachers and inexperience. According to these reasons, building schools in each village and sending many capable teachers are a convenient solution for these areas.

On the other hand, the second solution that some have suggested is to provide computers and internet access for rural students which is quite useful for educational purposes. The internet can expose pupils to a world of knowledge. Besides, studying through the internet and researching some subjects that are related to their lessons in school are quite beneficial for students. They can become familiar with new educational methods and ~~they~~ can read new books, essays and magazines via the internet like other pupils in urban areas. Moreover, studying online courses through the internet is a convenient way for some students in rural and remote areas who ~~they~~ do not have access to school, so that they can study whenever and wherever that they want. For instance, some students in remote areas of India, are studying online courses via the internet, and this is a successful method in this country and could be a good example for other countries.

 in conclusion, I opine that educational services such as school, teachers, computers and internet access should be supplied for students in rustic areas as these have a key role in the future of their country and they should have ~~been~~ equal rights like ~~than~~ the other children.
