

Many people think that the government should spend money to explore the outer space, while others believe that it is a waste of public money.

Discuss both views and include your own opinion.

In recent years space exploration has been one of the most important projects which the governments have concentrated on it, in most parts of the world. Even though these researches have a lot of benefits for us and our planet, spending too much money for these purposes has its opponents. I believe that the governments should allocate a part of their budget for exploring outer space because it is important for human life.

According to some, knowing more and more about space, monitoring our planet from a long distance and gaining information about other planets has different benefits for humankind. Nowadays scientists launch some satellites in the orbit for many reasons one of the important of which that one of the important of them is finding some problems on the Earth. For example, Research about atmospheric changes and forecast about some natural disasters like hurricanes through satellites is quite a beneficial methods to avoid such crisesthe crisis. Furthermore, overpopulation and lack of natural resources are other reasons that convince scientists convince to do research on other planets for finding signs of life in other parts of the solar system in order to sustain life.

On the other hand, opponents believe that exploringe the outer space is a waste of time and money. They believe that there are many difficulties on the Earth which the governments should attend to them such as poverty, air pollution, health problems and much more besides. Moreover, these researches are often capital- intensive and /therefore/ for this reason / it might impose more-higher taxes on people. Also, they argue that space exploration does not have any positive effects on their life. In addition, finding other planets for living is like a dream for opponents.

In conclusion, I opine that discovering of the unknowns and spending money for these researches should be one of the priorities of the authorities via which we can live on- in a better condition.
