

● **Students in school and university learn far more from lessons with their teachers compared to other sources, such as television or the internet. Do you agree or disagree?**

Some people argue that the main source to get knowledge for students is what they are taught by the educational system. I disagree with this idea because while children learn science and technology at school, they learn a lot of facts about social life from their family and the media, so I think ~~the~~ both sides s have ~~thea~~ same weight in someone's learning.

On one hand, most of the lessons that ~~be are~~ taught at universities and schools are about facts and using the instruments. Although this information is necessary for students' future career and helps them to become successful, children should learn about social communication and how people live in different places. Bringing children up and showing the other people's s living conditions, family and the media have a greater role ~~rather~~ than the Educational system. Adolescents spend a lot of time ~~to~~ watching TV, surfing the internet and speaking with their families and friends ~~that~~ which leads to forming their relations and gaining social knowledge.

On the other hand, developed and providinged great access to data, the internet makes s it possible to learn about anything someone wants without participating in a class, and individuals learn more and more from the media, so not only do students not learn most of their knowledge from school education but also they may learn more from the media. For instance, TV shows a lot of extremely successful people who did not have access to school, but they have learned anything they need from other sources.

In conclusion, in my opinion, although participating in schools and university ies classes is an important source ~~for~~ of learning, other sources are as important ~~as it~~.
