

Some people use the Internet to search for solutions to their medical problems. Is it a positive or negative development? Give your own opinion and examples from your experience.

The advent of the internet has significantly revolutionized the way we live. Nowadays we are benefiting from the Internet in almost every aspect of our life lives from contacting our loved ones around the globe to finding remedies to our health problems. This has become/became a controversial subject amongst many people who believe this not a reliable way for health-related issues. This essay elaborates on both advantages and disadvantage of this approach besides my own viewpoint with some relevant examples.

People who are in favor of online remedies claim that online solutions for simple medical issues such as minor headaches, stomach aches or some mild flues are is-a wise solution and can save a great deal of money and energy worldwide. Additionally, this is an effective method for those who are working far away from medical facilities. Individuals who are involved in oil and gas fields, sailors and rangers are obvious examples of the ones who may benefit from this kind of solution foremost. Furthermore, surfing the net with the purpose of finding solutions to health issues can improve our general knowledge in medicine, and admittedly not only can it lead us to a healthier society, but it also helps us to make an informed choice consulting physicians.

On the contrary, many argue that search the Internet is not a reliable way to find a solution for our health-related problem. Although this seems simply the cheapest way, specialist active in healthcare do not recommend it in most cases. Depressed and his left leg paralyzed, a British ranger who tried to inject himself a painkiller in Amazon was in the spotlight a few months ago. Had he known the right way of injection he would not have had his leg paralyzed. That this method is not an appropriate replacement for traditional treatment by physicians is an undeniable fact confirmed by a large group of experts in medical science.

By way of conclusion, I opine that although my vote goes for technological advancement in most areas, I certainly do not agree with the idea of looking for treatment for people's health problems. Only if-when individuals do not have access to a reliable physician, does this solution work in some rare cases. I strongly believe that should a patient have some basic knowledge in medical science, can this way can help people suffering shortage of healthcare.
