

The Public transportation system is one the aspects of development in every country, and governments should work on those to offer their citizens a safe and fast transportation system. However, when the question arises ~~on~~ if a government should invest ~~in on~~ constructing new railways, or they should spend on developing the existing ones, people have different ideas. Here, ~~I'm~~ I am going to discuss both ideas and include my own opinion.

People who follow ~~s~~ the first opinion ~~,~~ think that railways are a fast and safe way of communication between cities, and therefore they want new railways as much as possible for their commute. The other reason to support their idea is that ~~,~~ railways have the possibility to carry tons of goods at once which leads to much lower price ~~s~~ of products from one side of the country to the others ~~s~~. They also believe that railways decrease the volume of traffic between cities which is a big problem nowadays in all countries worldwide. A best example of railways usage is ~~the~~ Singapore, in which the railway system ~~,~~ called MRT ~~,~~ is used by all people instead of their own cars, which resulted ~~to in no little~~ traffic ~~at all~~ in the country.

On the other hand, people who believe ~~s~~ the government should improve the existing lines support their ideas with the reason ~~of that the~~ existing lines are one of the most used systems by people and therefore they should be in a good condition.

In conclusion, I personally believe that ~~,~~ the national budget in a developed or a developing country ~~,~~ should be distributed for improving the existing railways with a priority of constructing new railways.
