As populations grow, the pressure to construct ever-taller buildings to provide accommodation and offices increases, some object to such development due to the social and physical dangers. Do you agree with such an abjection?

With growth of population and migration of people from small cities and villages to big cities/megalapolis, one of the biggest issues in front effacing authorities has been settlement of people and accommodation. Building new houses and apartments, however, in many regions overpopulation of the crowd has resulted in shortage of land around the world such as in Japan. As a result, taller buildings werewas the only solution. Nowadays we witnessed skyscrapers around the world with different shapes and heights which are applied as trade centers or people's settlements. Though these tall architectures solve the problem of land shortage, some believe that these tall structures have physical and social dangers. Personally speaking, I agree with them for a couple of reasons.

the First and foremost point is the concept of ocular beauty. Compare a huge crowded city with hundreds if of tall skyscrapers everywhere with a town with beautiful two-floor storey houses, where trees and flowers are the attractive features of it. How enjoyable it would be when you walk in green streets, you can watch scenic landscapes of mountains and big gardens with singing birds rather than gloomy pictures of tall apartments with dark colors. Moreover, such living in such an environment may result in spiritual illness, that is why one if of the suggestions to depressed people is going to nature, far from the city to amuse life themselves in a calm and peaceful place.

Another influential point which mega cities are involved <u>in</u> nowadays is air_polution, this is the result of many different factors, However, tall buildings <u>is are</u> one of the most important ones. In locations where a city is surrounded by mountains and there are a lot of skyscrapers, the amount of pollution is high, because these structures are an obstacle against wind, therefore, the current of the stream Of wind would not occur and pollution of cars' fuel and big factories stays in the

atmosphere for a long time, consequently level of carbon dioxide would increase. In other words, the high rate of toxic gasses leads in to rising rates of sicknesses such as cancer and heart attack, problems which as are really common these days and doctors' advice is leaving cities and staying in smaller towns with clean weather.

All in all, there are some undeniable advantages into in building tall structures everywhere, problems such areas with an ugly face, meaning where someone looks there is iron, stone and cement and such picture is seen everyday would make people bored. Additionally, there is are issues related to pollution which governments are obsessed with; environmental and climate I problems are among those issues which are costly, both in the number of ill people and the amount of money which is dedicated by governments for such problems.
