

In some countries, many people do not have enough money to access the Internet. Should governments be responsible for ensuring that everyone can get access to the Internet?

There is the great deal of controversy as to whether the government should allocate funds to the Internet users or not. The Internet has a lots of advantageous and disadvantageous factors so that the positive ones outweigh its drawbacks.

The Majority of people are connected to each other via the Internet and they could not live without it even one day. For example, bachelors who are studying abroad have to use the Internet for calling to their families or making profit from the net for searching about their fields.

It can be also useful for the elderly group of society when they are passing the retirement time , they can enjoy the big universe called “the Internet”.

Using the new technologies and facilities has a big impression on life of humans in terms of wealth, economyics and movements so that governments should be aware about /of this matter and make proper infrastructures for the citizens.

Using public technologies such as the internet by ordinary people are also leads to growth and develop of countries but it may have-be a double-sword-edged edge sword so that people use it for or against national profitability.

Internet companies can play a big role in this issue and if they cooperate with accompanied to the government most of people would use and enjoy it. For instance, they can get lower profits to globalization the Internet and then make profits in terms of quantity instead of high range of prices.

Finally, I believe that governments should allocate budgets and subsidies to the Information technology programs in order to help talents flourish. ing talents.
