

With increasing car ownership, the amounts of traffic in many cities cause major problems. Extending and promoting public transport services, such as buses and trains, would provide the BEST solution for these problems.

To what extent do you agree or disagree?

Nowadays car extension causes major problems in all over the world such as traffic, air and sound pollution. In my opinion, while we have not suitable infrastructure in public transport, we cannot stop increasing car ownership.

With regards to individuals, the problem of public transport has had clear disadvantages. Firstly, they are more crowded in the peak time that cause people wait for suitable bus or train that they can find a seat. Secondly, there is no privacy in public transport; there is noisier situation than one's own car because of people not regarding others' rights. Someone speaks to his cell phone loudly, some other watch your screen and etc.

On the other hand, the effects that public transport has have on society and community can be seen as positive. With the best transport infrastructure, government can put a higher tax on cars or create more traffic zones in city centers. These limitations decrease traffic and provide more facilities in transportation.

People can reach their distance faster and easier than own cars. The pollution decrease and the air become more clearly. Extensive and efficient transport services can concern people to use these systems against of self-cars. Also they could economize on fuel and other urban resource.

To conclude, although car ownership have some efficient for individuals, it has not the same effect on society and the city. Local governments should do more to try and improve the public transport in order to promote people for use of them.
