

Technology has made children less creative than they were in the past.

In the present era of fast life, we cannot omit the role of technology in our daily life routine. The merits and demerits of new gadgets are combined with hours of usage and user age. There is a big debate on this issue.

The advocates claim that recent technologies ~~make~~ has made life easier for new generations. Gone are the days when students ~~should~~ had to carry on heavy books to school. ~~Now a day~~ nowadays, they use computers in their classes. Furthermore, the latest technology by using a variety of things gives more ideas and improves their creation. As they believed, this generation has more access to new ideas and thoughts so ~~that~~ they are more creative than past generations.

On the other hand, the opponents declare that new games make children lazy. As they say in the last generations because of different games and activities they had, kids were more creative. ~~On~~ those days there were few toys so kids had to think about new hobbies and games. As far as they are concerned, parents spend less ~~hours~~ time with kids because they believe that buying more technological equipment is enough to raise children.

Were I to comment on this debate, I cannot vote for any parts owing to the facts that were mentioned above. Furthermore, I assume that every innovation has its own strength and weakness, so it is related to us as to how to gain benefit from it.

To make a long story short, we should bear in mind that parents should spend more time with kids in order to make them ~~creator~~ creative and avoid any harmful damages in their character and health.
