

Many people believe that it's better to learn something in a group rather than individually. Do you agree or disagree?

Today, with regard to the importance of studying as a lifelong activity which is started from early ages and kept up until old ages, different characteristics ~~has~~ have ~~its~~ their own study regime. Some individuals are of the ~~same~~ opinion that studying alone has ~~been~~ helped them to deepen their own knowledge by digging through materials by themselves, while other ones subscribe to the view that ~~seeking~~ working in a small group of students s bounces their ideas off each other. My firm conviction is that studying in a group would be a more efficient way on the grounds that I will explore in the following paragraphs.

To begin with, it cannot be denied that studying solo has some significant advantages for those people who have their study techniques because it requires some quiet space to concentrate on their studies. Not only does studying solo minimize distractions around people because there is no one around them to divert their attention, but also they are left with the opportunity to get through each section faster as well as ~~can~~ being able to go at their own pace. Simply put, this pacing can be extremely beneficial for learners to read at a speed that suits them to learn profoundly ~~by their heart~~. In addition, some people with a learning disorder such as dyslexia may require improving their focus with working harder than others as they often struggle to read even relatively simple texts.

Although there is no doubt that studying alone has had ~~a~~ various merits for some people, the beauty of studying in a group would be obvious. The increased motivation is the main factor that gives rise to having others around to prevent ~~to become~~ becoming off task. Therefore, having that group will allow learners to breeze through tasks and maximize the time they spend study. Furthermore, some students ~~have~~ procrastinated until the last minute before exams s and being in a study group might yield the best result because they are obliged to pull their own weight as well as hash out obstacles by picking up their peers' study techniques that work for them. Last but not least, retention will come from the ability to vocalize ideas which you may have ~~to~~ with someone else

which ~~this technique~~ offers assistance ~~to~~ in recalling information better. For example, medical students require a great deal of memorization of information which cannot be learned by rote learning. The more they repeat information, the stronger their long-term memory for that information becomes.

To conclude, although individually studying methods ~~has~~ have a wide range of great effects on students' improvement such as allowing them to pace themselves, for those people who are interested in some back-ground noise or the company of friends would be more effective to be in a group. I strongly opine that not only does studying in a group hone people's skills but also it breaks the monotony due to some tedious topics. The method of learning really depends s—on people's personality as to how the method would be more adequate for them.
