

Online education and training is becoming increasingly popular in the business world.

Do the advantages of this development outweigh the disadvantages?

Today, online education is definitely one of the newest and fastest moving industries. Even though, many students perceive it as an improvement in learning techniques, while others think that it is not as much effective as classroom learning. In the following some merits and demerits are discussed:

More and more students are opting to getting their degree this way instead of going to a land college, mostly due to the convenience of the schedule. It means that you can manage your workload to suit your own circumstances. For example, you may be in full-time employment or in a position of some responsibilities relate to your family. So, what you definitely have less of, is spare time. On the other hand, this technique of learning is less expense, either course's cost or comminuting's expenditure.

On The reverse side of the coin, this method of learning involves you in becoming a self-study learner. Moreover, there is no face to face contact. Also you have less teach-student interactions that cause less monitoring on your assignment and project by your tutor.

To sum it up, I personally opine that, although distance teaching and learning give rise to that students have more autonomy, moreover, taking responsibility for their own learning, it have a less efficient method than that of in the classroom. In fact, it would be better method provided that individuals apply it that to those who havebe occupation with full-time employment and have less of the time-time to studying, not students that all they have to do is study.
