

The world is consuming natural resources faster than they can be renewed. Therefore, it is important that products are made to last. Governments should discourage people from constantly buying more up to date or fashionable products.

To what extent do you agree with the statement above?

In times of rising major cities, consumers of leading- edge devices and new fashionable goods is-are rising too but rapidly. People demand for up-to-date products every few years and as a result most of the people are becoming blind consumers.

On the one hand, many people opine that there is no panacea for the country's-countries' economic problems unless there are many-a great demands for companies' productions. Economic-Economy is often quoted as a factor behind the consumption of national resources, thereby developing in an unsustainable way. Governments have to introduce tougher laws to prevent this unsustainable growth or at least finite-limit the use of resources because the more consumption, the higher the rate of instability in future.

On the other hand, measures could take place in order to lessen the disruption of the environment. Governments or companies' legislations would have solved the disruption of natural resources at the very beginning, had they focused on recycling products they produced to give an up to date version to consumers. For instance, when people are longing for buying a flagship smartphone, the company should take the old phone in case of not having a new owner and then provide individuals with a newer version.

I am personally inclined to agree with the idea that taking recycling into consideration coupled with limitation of using the world's resources can solve most of the problems with consumption.
