

The exploration and development of safe alternatives to fossil fuels should be the most important global priority today.

To what extent do you agree or disagree?

Today, rarely can you find a country without using fossil fuels. In fact, as more countries develop their industries, the scale of their consumption continues to grow which is can threat our future life.

To begin with, although the usage of fossil fuels is not recondite to us, mutually, we are well aware of the detrimental effects that this source of energy has. Such as, all kinds of pollutions stemmed from the releasing carbon dioxide as products of fossil fuels. Subsequently, affected affecting the animals' habitat, global warming has been caused by damaging the damage to the ozone layer, so these environmentally irreversible changes remember remind us to take into account some safe alternatives instead of fossil fuels.

While some countries use clear fuels like wind, water, and solar energies, investing in these kinds of fuels is not enough, so they cannot play a pivotal role as much as fossil ones. Also, it may be true that there are other priorities such as, poverty, illness, and addiction that ought to be considered. However, the issue of fossil fuels is one of the energies which permeate all of our daily life.

Taking everything into consideration, I personally opine that this problem threatening the whole planet is globally rather than nationally. By this, I mean that no action by a single country could solve it. Moreover, as nobody knows how lofteng our planet could be able to lasting and support us from these damages, so putting into action meticulously planned programs as alternatives to fossil fuels is crucial.
