

The Climate crisis, is one of the greatest tests that mankind is facing during this modern era. The ability to overcome this environmental phenomena depends on the unity of scientists, activists and politicians to take the necessary actions. loss of Several plants and animals species, a dramatic rise in temperatures all around the globe and carbon footprint are among the main concerns being discussed in international assemblies.

Mother Earth's natural habitats are designed in its their best way possible to keep life going. Extinction, results in reduction of livestock variety, and therefore confounds nature's ecological chain. As this happens, basic human basic needs such as food is are being compromised. So it is logical for many people to assume that this is one of the major events regarding the environmental crisis.

Besides the aforementioned issue, several other activists are focusing on the temperature rise. The more the natural temperature pattern changes, the more some parts of the world become unlivable. Ultimately, this can cause severe damage to the planet's water resources that eventually diminishes agricultural production. Carbon footprint is another major concern as our air that we hold our life onto, is becoming more and more polluted each and every day.

Regarding the climate crisis, we ought to see the bigger picture to connect all the issues going on. Every single problem that it is being pointed, matters in order to save our

planet. There is no such problem as the most or the least important. We can only prioritize our order of action and we only have 12 more years to reverse what we have done to our planet. Our time is limited and the clock is counting.
