

Developed countries have created many environmental problems in the world, particularly in their contribution to global warming.

Why is global warming a problem?

What can be done to reduce the dangers of global warming?

Today, hardly a day goes by without hearing about the anthropogenic influences on the environment. Accordingly, global warming has accelerated since the humans have started polluting the atmosphere with fossil fuels and industrialization on a large scale.

It should be said, the warming phenomenon can give rise to many detrimental consequences. First of all, global warming translates into sea rising levels resulted from melting glaciers and decay of the ice sheets on the oceans. Moreover, not only can this rising pose coastal settlements at the risk of submerging, but also it can lead to irreversible damages on to biodiversity such as destroying flora and fauna habitats, migration of native species like marine mammals, as a result of these climate changes.

Taking everything into consideration, I personally opine that government, authorities and even every individual can ameliorate this situation threatening the whole planet which nobody knows how long it could able to lasting, so putting into action meticulously planned programs such as replacing fossil fuels with some safer alternatives like water, and solar energies, investing in these kinds of fuels, and also introducing efficient laws for factories to limit their environmental pollutions, and encouraging people to decrease overconsumption of plastic production, are crucial.
