

Many companies sell products or services but at the same time cause environmental damage. Someone said it can be stopped by pay penalty. Such as a higher tax when they cause environmental damage. Others said there are better ways to stop them from harming the environment. What do you think is the best way to prevent the environment from deteriorating?

There has been a heated debate over environmental damages. In fact, climate changes and environmental problems have made everybody concerned about the future of Earth. I personally believe that money cannot make up for the harms we do to nature. In the following paragraphs, I will elaborate on my arguments.

To begin with, without a doubt, most of the blame lies with companies, so they have to change their approaches. Experts believe that the first step they should take is increasing their electricity efficiency. That is to say, producing electricity takes too much fuel which ends up with greenhouse gases. As a result, should they improve their electricity system, their emission will be decreased. Besides, they should apply renewable resources in order to reduce water and air pollution, because the factories dump their waste into the rivers contaminating water and harming the food chain.

Second, legislation should be introduced to compel the factories to recycle their waste. This action is a win-win situation. To put it simply, recycling the wastes can prevent damages to the environment alongside cutting their costs.

However, it should be considered that the amount of companies' production depends on consumers' demands. In other words, I admit that having adopted consumerism approach, we, customers, have a direct impact on the environmental crisis. Consequently, we should reduce our demands for goods and not be trapped in advertisements encouraging to overbuy.

To make a long story short, I opine that fees cannot be applied as a long-term answer to this problem. Protecting nature is a social responsibility which we all should exercise and take concrete steps to ameliorate it. These steps include from not using plastic for shopping to replacing fossil fuels with natural counterparts. Above all, we have to teach our children that they have to play their role in this crisis, thereby guaranteeing the future of this planet.
