

Some people say that the main environmental problem of our time is the loss of particular species of plants and animals. Others say that there are more important environmental problems.

Discuss both views and give your opinion

There is a general concern about the extinction of some plants and animals as an important environmental problem. Some people believe that this issue is the most crucial one, while others think that we have numerous other environmental issues which need to be tackled urgently. I personally ~~do~~ agree with the ~~latent-latter~~ group.

Every single species of plants or animals ~~have~~has an influential role on the earth, our home planet. Nowadays, many of these livings are endangered due to human activities like overhunting or habitat destruction. People should be more alert about consequences of such these activities. Extinction of any animal or plant can be life threatening to flora and fauna of its district and can trigger a defective cycle, hence the importance of preventing Hence it is very important to prevent these cycles.

On the other hand, the earth is facing a number of other issues which can cause disappearance of different ~~types~~s of livings, even human beings. Climate change itself is the starting point of ~~dy~~eing out for many plants and animals. Global warming has been one of the greatest issues in the last decade and it is still worsening ~~yet~~. In addition, plastic pollution is widespread and out of control. To tackle these concerns, all of the nations should compromise to be committed to some harmonious actions.

In conclusion, even though it is very important to protect wildlife, there are several basic problems which need instant effort to be solved. In my opinion, loss of particular species is important but not as important as other environmental concerns.
