

Agree-Disagree

Educating children is a more difficult task today than it was in the past because they spend so much on cell phones, online games and social networking web sites.

Learning an irreconcilable amount of materials and skills, children widen their horizons and develop a vast ray of abilities through educating which is a trend not set to do not remain steady in passing the over time. Although I can imagine the difficulties in the way of educating these trusting creatures individuals due to these cutting-edge technologies and emerging lifestyles changing the world, including that of the children, I can refer to the bright side of this phenomenon too.

Rarely can you find a child not holding a cellphone in his/her hands, in this day and age. Considering these literally smart objects accompanied by tons of abilities, we could even anticipate those poor kids drowned in the infinite of new-age facilities. A friend of mine has a long story on this topic with his son who unfortunately has been listed as a game-addicted ed. He told me once that not only does his son spend his all day before a brightly colored screen, but also he shares his night with those playing characters of games in his dreams. It gets worse when children leave the real world and fall into the virtual one and build their own societies using social networks radically. Totally, distracted by a buffet of these types of entertainments, children are becoming hard learners in our present system of education, on the one hand.

On the other hand, everything is the object of change in the hand of the time. It is true that these new styles have their own destructive effects but they are presenting other opportunities simultaneously. I remember the other day when I was searching for an application in a virtual store, as an example, which; no sooner had I opened the store than I encountered the uncountable types of educational applications.

In a nutshell, these new accommodations tools/utilities can affect the children's functioning in educating, as a matter of fact, but only when we consider every aspect of that, will we be able to judge judiciously. Obviously, it can serve as a double-edged sword, in my opinion. In fact, they are becoming fundamental instruments in educating, though they can fill a child's daily schedule itinerary inasmuch such that as/insofar as they eliminate the education from it.
