

Task 1
Cambridge 13- test 3

The bar chart demonstrates the amount of electricity produced and consumed among high ranked 10 countries over the year 2014.

It can be immediately observed that China by the far produced and consumed the most amount of electricity. However, the proportion of electricity was generated and used in Korea was at the bottom of the list over the period under review.

The proportion of generation and consumption of electricity in China was 5,398 billion KWh and 5,322 billion kwh respectively. The USA took up the second largest proportion generating and consuming, that were 4,099 and 3,866 billion kwh whilst this amount of electricity was approximately twice as much as those of in Russia and Japan over 2014.

It is noticeable that Korea was at the end of list among 9 other countries with roughly 4.5 billion kwh consumption and production. More over, the amount of electricity was generated in France, Canada, Brazil and Germany was around 520 to 620 billion kwh and for their consumption was about 450 to 580 billion kwh. It is clear that the amount of generation is more than consumption in different countries except Germany.
