

Some people think that resources should be spent on protecting wild animals, while others think those would be better used for the human population.

Discuss both sides and give your own opinion.

While many a person maintains that it is incumbent upon us to protect wild life especially animals, others, ~~however~~, hold that our limited resources ought to be dedicated to human beings. When it comes to this long-running debate, I subscribe to the view that we had better strike a balance between both viewpoints or we will face irreplaceable damages. The following lines elaborates both views besides my perspective regarding this highly controversial subject.

Many people of different social strata spend a good deal of their time and income on wild life because they strongly believe that protection of wild animals can have a direct correlation ~~on~~ with our life, making the old mother nature a better place to live for both ourselves and future generations. There is a large body of fascinating research conducted by scientifically reputable researchers proving if we stop spending on wildlife, we will face severe life-threatening impacts on life on earth, hence the importance of spending to preserve wild life and more specifically wild animals.

The opponents of ~~those who care about the environment~~ environmental conservation do not vote for dedication of any sort of support for wild animals reasoning that humans are much more important than any other form of life. We have to spend our resources on human beings, and not wild animals which do not play a major role in our life. This group claim that not only is spending on wild animals a waste of resource, but it also can lead to shortage of food for us. They argue that wild animals consume a large portion of edible available resources on earth leading to food shortage for humans.

From what has been discussed above, I can say that though important humans' life is, ~~but~~ we cannot overlook the importance of wild animals. To maintain a healthy ecological balance on this earth, wild animals, plants and marine species have as an important role as ~~have~~ do humans. Each organism on this earth has a unique place in the food chain that contributes to the ecosystem in its own special way thereby striking a balance seems unavoidable.
