

Some people claim that it is acceptable to use animals in medical research for the benefit of human beings, while others argue that it is wrong. Discuss both views and give your opinion.

The argument over the question ~~as to that~~ whether undergoing tests on animals is the best possible method to discover medical findings or not, has not been settled yet. Whereas using living ~~things-beings~~ as a medical laboratory test could offer better protection for individuals, this phenomenon may bring a wide range of side effects. Ultimately, I would believe that animal testing is morally wrong.

The primary reason why a considerable number of scientists prefer ~~s~~ to employ this approach is that animals have ~~the~~ same structure ~~like-as~~ a human to some extent; therefore, this similarity helps to ~~will-~~ have more accurate ~~anticipate-anticipation~~ about probable consequences which may occur to human beings. In other words, a lot of people firmly hold this view that these advances in terms of medicine could not have happened ~~unless had~~ animal testing ~~not had~~ been introduced to the medical fields. For instance, several successes in discovering appropriate cures for recent epidemics have been found thanks to these laboratories' research.

On the other hand, animals are living creatures that should have the right to live freely without suffering from various testings ~~being having been~~ conducted on them to develop an effective cure by scientists. Furthermore, it is widely accepted that this widespread using of animals ~~have-has~~ just worked over recent decades; as a consequence, humans ~~s~~ do not have an entirely accurate ~~insight~~ about the possible consequences. Accordingly, advances have occurred in the field of technology and high tech could bring a proper environment to analyze medical research instead of using animals; in fact, a growing number of computers' programs can simulate the human body, structures, even his genes with the help of gigantic servers, and experts in medicine could discover cures.

In conclusion, despite many positive points in the experiments on animals like similarity in the structure as well as finding a number of remedies, animals have the live right to enjoy their freedom.
