

Do you agree or disagree with the following statement? Although science and technology will continue to improve, the most significant improvements for the quality of people's lives have already taken place.

The advanced technology and its rapid-pace evolving enables most of the people to live more comfortably than their prior generation. Some people believe that this level of quality may be sufficient for ~~a~~ life while others expect more of life. I firmly disagree with those ~~group who are~~ considered this improvement enough and will elaborate my explanations as follows.

First and foremost, ~~the~~ quality is a relative concept which has no absolute meaning or quantity. The comfort that people seeking in a region may be the minor level of everyday life of other regions. That is to say, life quality varies in different people worldwide. For instance, the free-widespread 4G internet is a wish for people living in a developing county while in the developed ones not only is this facility an usual highly-available thing, but also their 5G internet technology is progressing rapidly. Plus, the human needs and requirements are constantly changing and there is no end in this trend of human being. Namely, the 3D printers which had been a revolutionary invention once for the industry not so long ago, nowadays, is getting specialized to use as an office or even home devise. Moreover, the materials using for creating the print is getting more and more cheaper with less harm for the environment.

Furthermore, every invent or improvement leads to a new requirement for people. Desiring the better and higher quality of everything roots in human nature which has been the main reason /drive for the man's development. In addition, necessity is also an ever-changing concept in today's life and there is no limitation in our cravinge for excellence. In other words, each invention is like ~~a~~ the first step of a new way of other possibilities. For example , each year we are facing new features in our smart phones and it seems there will be no termination for that innovations such as the quality of devise, the processor speed, the battery life, the camera lens precision.

To sum up, I should state my opposition to the notion of those people who believe that the ~~so far~~ improvements so far has already fulfilled the need of high-quality life of people; hence, the quality cannot be measured or restrained and each development itself necessitate exploring more in respective area. Although it has been an acceptable level of advance for now, It has to be an ongoing prosses for ~~a~~ better living.
