Students are more influenced by their teachers than by their friends. (use reasons and examples) <u>agree/disagree</u>

As we know in the student period, we have some major steps of cognitive evolution. In mind's maturation processing a teacher could play a central role as parents do. Because of the deficit in advanced levels of thinking, in the first step, the role of imitation would be crucial. students are constructing the infrastructure of their desires, favorites, moralities and social interaction modality by replicating the behavior of authority sources (like parents and teachers). For example, for a 7-years old boy, pouncing on people is good because his father kicks others or learning knowledge is good because his teacher has a good level of knowledge; So the student embodies himself in the future as a person in a biology lab who is looking into the microscope and is composing some material. Maybe he tends to be a geneticistmathematician or biologist.

In the next step parents and teachers can orient a student's behavior by using reinforcements. The student eagerly treats sb nicely because his teacher applause applauds him more for it or the insulting is bad just because his mother punished him when he insulted his friend.

some years later, he will obtain high—performance neural cognitive computing. he should consult with an expert adviser

who knows about his personality and interests to purposely dedicate his time for developing his skills. A secure teacher in this stage could be vital.  $\sqrt{\text{affect}, n} = \sqrt{\text{algebra}}$ 

Indeed, if we look accurately friends along brothers or sisters can profoundly affect a student's life a lot but absolutely it's not as much as parents or teachers do;

Eventually we can conclude that home and school are the most important organs in primary years and parents accompanied \_ and teachers jointly have a huge impact on our monumental life's events.
