

## Computers are becoming an essential part of school lessons do the advantage of this outweigh the advantages?

Nowadays, computers are playing as an integral part in the school's schedule for students. I suppose that the benefits of working with the computer as an educational module could overshadow some unfavorable aspects of using it. Dord = Density/density D or d = density

It would be universally accepted, on the one hand, that computers could have an array of significant roles in the learning style of a student when it comes to being as a unit/lesson in their school syllabus/curriculum. This would mean that learners would sift through their information based on their needs. Such a method of organization might provide them with opportunities to save their precious time and energy. This is due to the fact they would have access to all the relevant data **in the blink of an eye/ for a short while**. In doing so, students could assign their time to extracurricular activities such as taking part in doing sport, writing code, and having pleasure time with their families and friends, to name but a few. With the aforesaid favorable features, learners, in the long run, might become more intelligent than ~~that~~ those of graduated/graduating in the past decade or two without having computer lessons in the school.

Some negative points of the computer lesson in the school, however, could be that those who just rely on computer tools might not be able to calculate numbers with their mind in the future. This, albeit manageable, might cause them addiction/they them to become addicted to the computer programs such as excel, calculator to solve any mathematical question. This being the case, not only might make learners being indolent but also they would lose kill their inventive minds. These shortcomings, in the long term, would lead students to be faced with physical and mental problems/disorders.

To sum up, regarding the debate surrounding whether computer lessons could bring students some benefits or not, I suppose that using the computer would make them more inventive although they should not fail to working with their mind and computer simultaneously.
