

## Handwriting today is less formal than it was in the past. What are the causes of this change? Is it a positive or negative development?

Over recent decades, people have changed the ways of written communication and ~~replaced~~ substitute machine type ~~for~~ instead of using their own hands to transfer information. There are several causes behind this replacement. The question that arises is whether this change brings more advantages or disadvantages.

Admittedly, advances in technology have likely contributed to a prelude of a revolution in written communication among all people. In other words, our ancestors used to write a letter in order to inform or ask about varied subjects. Whereas, now, the computer's text is altered to the old-fashioned one by the world's citizenry. Furthermore, heavy ~~maintain~~ maintenance costs of written official letters may be cited as the other reason why people have changed their tendency to utilize email. To put it simply, the process of producing paper is relatively high, and along this, huge space should be allocated to keep these official documents in comparison with clouding ones. To exemplify, with little payment in Dropbox, a specific virtual space is dedicated for storage, even these are highly accessible everywhere.

On the one side, switching to print in a business workflow is beneficial since differences in shape of handwriting are diverse, and thus, the readability of text might decrease drastically. Besides, grammatical or lexical mistakes s in a long text could be hardly fixed ~~hardly~~. Nevertheless, using hands is one of the motor skills with which the brain could develop and expand significantly. This is to say, all people from schoolchildren to the elderly are in danger ~~of endangered of~~ losing part of creativity and memory as long as they do not use their motor skills in their lives. Thus, it is ~~substantial~~ essential to acquire this ability.

In conclusion, advances in technology mostly offer a wide range of facilities from accessibility to maintenance in the field of written communication. From my point of view, this revolution could be considered an affirmative development due to being easily repairable ~~fixable~~ easily and high pace in reading as long as handwriting is taught as well as utilized in different aspects of human beings.
