

Some people think that genetically modified (GM) crops are a positive development. Others, however, argue that they are potentially dangerous. Discuss both these views and give your own opinion.

In this day and age, science and technology have changed every aspects of life. ~~The the~~ greatest advancements have ~~has~~ happened in the ~~on~~ agricultural field which includes invention of new instruments and devising creative methods of growing one of which ~~One of the most popular methods~~ is growing/raising modified crops.

Some believe that this method not only leads to more advancement in future, but also it will provide food resource for the growing population.

As a matter of ~~the~~ fact, the world population is increasing, while the natural resources are decreasing by far more speed. Therefore, we are obliged to find more effective ways than encouraging individuals to consume less. They declare that there is no better way to tackle this issue.

On the other hand, some argue that this way of production might not the best of addressing the problem. Although scientists could gain a large amount of crops by using this method, they have not found the consequences of this method on the human health.

They hold that scientists are not allowed to endanger the people's health even if ~~;~~ they are trying to find a way to rescued the poor from starving, or in ~~the~~ other words, giving a life at the expense of ~~on expense of~~ pushing people to unknown disease is not acceptable.

To sum up, some believe that we are forced to use a new process of agriculture/planting such as GM. On the contrary, some assert that scientists should be banned from using to ~~use~~ this method on the human body until ~~since~~ its consequences would be defined.

I do believe scientists are required to find new methods because of food shortage. However, they should be sure about all aspects of every method which they are going to implement on life.
