

Increasing the price of petrol is the best way to solve growing traffic and pollution problems.

To what extent do you agree or disagree?

What other measures do you think might be effective?

The number of cars has been increasing day by day and it is predicted that the amount of carbon dioxide will have doubled by 2025, hence, we should stop this process with-
by increasing gas prices and other measures.

The easiest way to encounter traffic jams and pollution seems to be increasing gas prices. In this case, people tend to turn to public transportation because of high prices of petrol. It can lead to alleviation of the strain on the street. On the other hand, big corporations invest in finding some acceptable alternatives to existing cars in order to manufacture vehicles working with renewable energy like sun and electricity. Nevertheless, increasing the price of petrol can have a negatively effect on inflation due to raising transportation cost.

It is believed that we should take other actions as well as raising gas prices. One of them can be spreading public transportations' infrastructure such as constructing subway lines, producing buses with high standard and arranging punctual timetables attending-
on time in the bus stations. The second one is promoting distance learning or telecommuting which do not require has not the necessity for attending individuals' attendance in the workplace. Consequently, it prevents some unnecessary commuting. The third one as mentioned above is encouraging people to use cars working with electricity or sun energy for this purpose we can reduce tax and insurance rates the-
price of tax and insurance for these vehicles.

To sum up, in my opinion, what we should consider is raising the petrol price will not fulfill all of our expectations, if we perform it as the only way to tackle traffic and pollution ills.
