

Nowadays technology is increasingly being used to monitor what people saying and doing (for example through cell phone tracking and security cameras). In many cases, the people being monitored are unaware that this is happening.

Do you think the advantages of this development outweigh the disadvantages?

Technology's technological developments have pervaded many aspects/corners of our daily lives, whereas these achievements, especially in the field of electronic instruments, have been used for overseeing/controlling ordinary people and spying consumers of these high-tech products throughout their hand-sets or watch-over cameras.

Some say every step which have been takeb passed toward forward to mechanization, has have moved human-kind far from individuality/privacy personalization. They assert that although old days when which there were no electronic devices in homes or in our pockets we had difficulties connecting to each other, when you had stepped inside your house and closed the door you had your privacy and there were not any spying eyes or ears on you. Furthermore, these advanced instruments have taken the information's diffusion under their control.

On the other hand, there are technology's defenders which claim that every new device has have pros and cons and benefits of new electronic inventions surely outweigh their disadvantages. Besides, every instrument has have some blind spots which can be used by customers. In addition, there is not any obligation for using cell-phones and there are rules for installing security cameras such as any mounted monitoring camera must be announced informed in public by wall declaration and any claims about personal data leakage can be taken into court by claimants.

From my point of view, although technological technology's achievements have colored our monotonous lives, such drawbacks like losing privacy are is worth thinking about again when new instruments which you do not know all their capabilities are introducending for use, Albeit by with exploring these new utilities, the user can find their disadvantages and control them. Any spying device has have some pre-requirements that with knowing those requirements you can neutralize them.

In conclusion, the services that technological advancements have provided for humanity are undeniable and despite all the downsides that new electronic achievements have, their merits are more remarkable and outweigh their discoverable and controllable disadvantages.
