**Do you think that modern technology, such as the internet and computers will ever replace the book or the written words as the main source of information?**

Nobody can deny that recent technology has grown rapidly in the past few years and researchers predict that it will develop faster in the future. Some people think the print book will be replaced by computer devices and internet, others believe that the number of printed books will decrease certainly but hardcopy books will continue to exist /print in the future. Although the internet and computer devices have become important parts of our today's life, I do agree hardcopy books are the main source of data.

On the one handside, it is true that with the computer and the internet, individuals can access ~~to a~~ a vital range of information, they can turn on the computer and connect through the network, search for valuable information and articles in the world wide. In addition, there are many news corporation advertisements and electronic newspapers these days which can be read by the cell phone and or the notebook easily.

Moreover, some people prefer to use computer devices because they believe that not only are electronic books environmentally friendly productions, but also a large number of trees and forests can survive and continue their life. In fact, they find the serious concerns of climate changes and try to improve the environment by reducing Green Household Gas.

On the other side, it is predicted hardcopy books, magazines and newspapers will continue to exist because of some simple reasons. Firstly, elderly people are uncomfortable with electronic devices. Secondly, some people think screen computer radiation is harmful for eyes and has gives negative effects on the brain and eyes. finally, all people in ~~on~~ the world do not have access to online services and then they need hardcopy books and newspapers.

In conclusion, there is no doubt true that the internet has helped people in providing information and access to wide range of data by just a click, but I strongly believe that written words/materials like books and newspapers will never be replaced by any kind of advancement devices as the main source of information.
