

Garbage

As a result of industrial development and population's growth , the contemporary world is faced with global increases not only in the amount of waste ,but also in the diversity of its quality .

Reusable and refillable of goods specially bags in daily routine can cause garbage reduction dramatically. Firstly , plastic bags can not return to nature , so people can use reversible materials or refillable bags . In this way , people can provide conditions for garbage reduction . Moreover ,garbage collection at the time of ecotourism can contribute to slightly declining ~~in-of~~ garbage amounts from the earth's surface . Also , buying in bulk rather than individual packages not only saves lots of money but also causes reduction in garbages , therefore buying juice, snacks, and other lunch items in bulk and using those reusable **containers** each day will contribute to the uncontrolled increasing in waste materials .

On the other hand ,people's efforts for contributing to garbage reduction will be useless without **government intervention** . First and foremost ,industrial garbages is are a fundamental problems which can put people's health in jeopardy . Therefore , governments can help ~~to~~ garbage reduction with elimination of **irreversible** productions . We know that electronics devices waste can cause health problems for people . Furthermore , states by with creating a recycling system where electronic devices waste return to new processes for producing usable goods facilitate a way for solving health problems issues . Consequently , manufactured goods which are made with recycled materials facilitate good opportunities for shopping for people.

In conclusion , in my opinion the increasing amount of rubbish has always been a center of attention . And there have been sums of money spent to address this problem . However , I suppose many preventive measures should be taken by both authorities and individuals.
