

Nowadays leisure industry products and modern gadgets are widely used by young people. The use of these products reduces the young generation's creativity. Do you agree or disagree with this statement? Give your opinion.

Using newly invented devices which changed our lifestyles during for the past few decades is a controversial issue and debates on whether using them by the young generation is beneficial or not is a common concern of elders these days.

Many say utilizing these advanced products of technology have pervaded our physical and mental activities and resulted in lazy bodies and brains consequently. Furthermore, putting easy ways for solving problems in front of our youth have weakened their innovation ability as we all know necessity is the mother of invention. Besides, filling all leisure time with these personal tools has have deepened the gap between people and cooperative studying and researching unfortunately.

On the other hand, proponents of these gadgets cite that these products have changed our monotonous lives and brought us up up us more free time for thinking and creating. Thanks to their ability of solving our easy challenges we have now been provided more time to challenge with tough ones. In addition, innovation needs relaxed body and brain which these utilities provide us this matter by preparing much more fun times.

I think although the helping effect of these devices and their applications on making greater more awesome leisure time for mankind is not negligible neglect able, using them more than usual will make the youth particularly gadget-addicted so that people cannot spend their lives without them. There must be considerations and limitations for using these utilities which have been made by the users themselves and **to this end** there must be more educations and prohibition policies which have been prepared by the government.

In conclusion, applying these types of tools has have magnificent advantages for people, whereas overusing them could result in more drawbacks than benefits. Therefore, using these devices must be under control and there must be plans for utilizing them in a proper way.
