

Governments should spend more money on railways rather than roads.

To what ~~extend extent~~ do you agree or disagree with this statement?

Every government ~~s~~ wants to provide the fastest and safest transportation system. It is a considerable achievement for them. Nevertheless, it is an important question, should they more investing in on railways or roads? In this essay ~~this essay we~~ will discuss these arguments before arriving at a logical conclusion.

It is accepted that railways are the safest transportation system. Every year thousands of people die because of roads accidents, this trend is far less for that of railways. Due to the fact that rail lines are also the fastest and programmed, people are able to save time and money through using this kind of transportation. ~~An another~~ significant aspect of railroads is, its positive effect of markets, firstly it is considered cheaper than roads for daily commute, secondly producers and companies can send tonnes of goods, crops and products through railways remarkably more than roads.

However, it is not deniable that, roads should be developed more in future. Unlike railways which it is require to book in advance, people can use roads whenever they need. Also it is connected to all cities, villages and everywhere in the country. Investing in on roads is are notably cheaper to develop. Another reason to develop more roads rather than railways is that most areas are feasible for roads and government ~~can not not~~ create railways everywhere. After investigatinge on these points of views, governments should decide which are is feasible for railways or roads. Nonetheless, to a certain extent, I would agree that we should spend more budget on developing railways. Since it has less harm to the environment and is also helps us to save time and money.
