

Every day more and more buildings are pulled down and replaced with tall buildings. Is it a positive or negative development?

One of the most important discussions in urbanization is skyscrapers and tall buildings. Many ~~of~~ experts believe speeding up of ~~the~~ construction could have after-effects such as inbreeding traffic, destroying the environment and destruction of the urban texture.

When constructions aggregate in the area, accordingly more cars commute so it causes traffic jams. For example, in the north of ~~the~~ Tehran there are many tall buildings where streets and alleys are not symmetric with them ~~and~~ so that we encounter heavy traffic ~~and this~~ which is due to the limited capacity of passing passages.

Another serious problem is that tall buildings can harm the environment such that they have influence on air pollution. For instance towers which have been built in the west of Tehran, have blocked the air current approximately and that's one of the factors in of air pollution of Tehran. In addition, by immethodical constructions perhaps many trees have been cut down off ~~and it~~ which has dire consequences for our environment.

Finally high-rise buildings can have a negative effect on urban texture namely old and ancient buildings. For example, we can refer to Yazd city, which contains many monuments. If tall buildings were created in that region it could damage them and caused irreparable losses ~~and that is~~ because ~~of the~~ tall high buildings Loosen loosen the soil region referenced.

In a nutshell, unconventional construction can have a direct impact on urban traffic, air pollution, and changes the in urban texture.
