

Examine the arguments in favour of and against animal experiments, and come to a conclusion on this issue.

Give reasons for your answer and include any relevant examples from your own experience or knowledge.

During the past decades, animal experiments in producing drugs and medicines have brought about caused a significant medical advancement. By using this method, scientists have discovered many products which potentially are life savers in many aspects, such as heart diseases and cancers. However, some people tend to disagree with involving animals in for medical tests/experiments for the sake of humankind. Therefore, I would like to observe these different perspectives on in my essay.

It is an undeniable fact that, the producers in this field cannot put their product on market without the knowledge of their functions and side effects. to put it in perspective, some medicines may have detrimental effects on human body and therefore, it is a convincing argument to test the primary products on animals before presenting them. In addition, as human survival is of utmost priority issue, exploiting animals is acceptable to benefit humankind.

On the flipside, animals rescue groups believe that people do not have the moral right to exaggerate torture animals for any proposes and human life is not superior to them. Moreover, there are many useful products on market which is are not necessary to be developed. Besides, other methods can be used for experiments such as, cell cultures. I opine, that animals involved should not suffer any pain in spite of their obvious benefits in medical industry and they should be reserved for more essential operation. Moreover, the usage of animals in cosmetic industry should be banned.

In conclusion, although animal testing animals-experiment has made a dramatical improvement medically, it should not be used in every examination and we should minimize their usage and reserve them for huge-significant/important discoveries.
