

Building similarities effects and solutions.

Global population is growing day to day and these new people need new places and privacy zones. The houses architecture is being changed a lot ~~in~~ compared to the last century. Especially in crowded cities most people live in apartments. Every corner you turn, you will see closed multi floor apartments situated a few meters far from each other.

One of the dilemmas in new modern life is architecture similarities in different cities. It is one of the essential items that could hurt economically and culturally ~~to~~ any country in terms of tourism.

Tourists go to new areas, new cities to see the differences in lifestyle and attractions and to ~~To~~ explore places. When everywhere ~~are is~~ alike, why should tourists should go somewhere else?

Also we call ourselves human because of creativeness. It is more beautiful to use our complex ideas in our creatures-creations like buildings **where** we live a considerable part of our lifetime ~~in them~~.

For ~~some instants~~ instance in china when you see the traditional houses with declivitous/tilted roofs, wooden doors and windows, in turkey old traditional malls, domedy buildings in Venice between water, all and all represent the influence of climate on local's life style, art and beliefs. Without ~~this~~ these differences cities are going to be like colonies for robots. traveling doesn't make any ~~sence~~ sense as before in these areas.

I beliee keeping the traditional style couldn't decrease the life quality in this exact point of time line that we are living in. or even if we think old styles aren't appropriate, creation of new ones ~~are is~~ satisfying . this way is better than making similar cubic ~~similar~~ buildings on the face of the earth.
