

Considering all technological advancement, do we still need to learn a new language?

Some argue that as nowadays we are equipped with advanced tools which easily convert a language to another in a glimpse, no more do we need to learn a foreign language and so it is a waste of time. I strongly disagree with this notion and believe that learning a new language is even more advantageous and ~~demanded~~ needed for people in this developed world.

Firstly, as a result of tremendous technological advances both in computer and transportation fields over the last half century, the world has become smaller and the information flow has enhanced in terms of speed and quality. ~~Subsequently~~ consequently, it is more probable that people are exposed to by different languages. For instance, thanks to the Internet, people can easily ~~can~~ connect to someone in another part of the world just through clicking a button; so that they are more likely to socialize with individuals speaking a foreign language these days comparing to the past. It is also much easier and cheaper to travel to other countries where your language knowledge enables you to mingle with various persons /individuals.

Moreover, learning a new language is not only a means to meet your necessities but also empowers your brain ability by memorizing new vocabularies and opens a new window to the world. Having a good command of a foreign language, people access new sources of knowledge, attitude, researches and mainstreams which expand ~~your~~ their perspective on life. In fact, recent technological thriving provides language learners with plenty of online tools and supplementary materials that make the education process even more convenient and pleasant.

All in all, knowing a new language would bring us more friends, knowledge, wisdom and many other positive outcomes, which is worth spending time and energy on ~~that~~ regardless of the fact ~~that~~—how ~~easy~~ much technological progress has made life easier /facilitated life.
