

Soon it will be scientifically possible to clone humans. What are the advantages and this advantages of this?

In the modern age, which is called the age of Technology and significant advances in Science, we are encountered with scientific claims and efforts to clone humans. Today, people live **a life of higher more longevity life** than **the** past due to breakthroughs in medical science and technology. In my opinion, cloning humans **s** has both its pros and cons which depends on the situation and the way it is used.

However, there is **a** strong **disapprobation** against human cloning. The major counter-argument is based on the fact **that which if it is** misused, **it** would have dangerous consequences. This technology can **fall into to the hands of terrorists / land up in terrorists' hands**. For instance, they can replace key human parts like eyes and fingerprint to bypass bio-metric security measures. Likewise/also, they can use plastic surgery techniques to fulfill their goals.

From another point of view, if human cloning happens, **the** general public will be provided with spare body parts. Cloning organs yields a more practical way when people want to live a longer life. **This method** can be used to replace **the human organs these** of **terminally-fatally** ill people. As we know, there are often inadequate organ donors around to fulfil this need, so by using this discovery we can overcome this issue as there would be always **a ready supply**. Furthermore, by using this method, people will be able to clone their loved ones and **departed/deceased** family members.

In conclusion, I believe that human **replication/reproduction** has many advantages **and boons** to humans. Yet, **the** government should **apply strict legislation** to ensure that **it** would **be used** only to serve humanity.
