

Should parents be obligated to immunize their children against common childhood disease?
?Or do individuals have the right to choose not to immunize their children

It is no doubt that one of the most important stages of ~~life's~~ children's life is to protect them against childhood fatal diseases, especially in early ages. Hence, the children should be vaccinated so that they stay healthy. However, there is also an argument that parents should ~~make own~~ their own decision whether their children should be immunised or not

One hand, it is said that prevention is always better than cure and thanks to the great medical advancement many diseases such as polio and rubella, which children ~~were~~ died of in the previous centuries, have been eradicated from most parts of the world. Yet in many poor countries because of lack of hygiene and sanitation water and food, these children are not well protected. Besides, maybe they get infected easily and even their lives are at risk

On the other hand, ~~that~~ some argue ~~who believe~~ that parents should have the right to decide to whether to vaccinate their children. Not every parent might understand the best condition of their children's health thus they should be educated about the benefits of vaccination. In conclusion, the vaccine is not only saving children's community but also the future of the nation. As a result, I have more trust in the policy ~~that whereby~~ the children should be immunized since they were born to prevent many deadly diseases
