

Some people claim that it is acceptable to use animals in medical research for the benefit of human beings, while others argue that it is wrong. Discuss both views and give your opinion.

In contemporary life, there are numerous methods on how a medical research should be conducted or an in vivo experiment should be done. One of these ways is animal experimentation and using living beings in a medical research. Opinions diverge on whether this trend is acceptable or ~~this is not~~ unethical.

Some people argue that when it comes to the human beings and what considered as beneficial for them, there should not be any disagreement on using animals as an experiment model since the life of human beings is more important than that of animals. Besides, they also subscribe to the view that animals are the closest creature to humans and when scientists use this animals as test model, the result is much closer to what happens in the human body. For instance, there is a research showing that near 85 percent of experiments which has-have been done by using animals, have positive results in human lives. Although using animals in experiments has such benefits, there are strong ethical issues that should be considered as well.

Some other people strongly argue that using animals as a test model is against the animal rights as it is a concerning phenomenon. They rightly believe that their live-life matters and using drugs and medicines on animals would undoubtedly make them suffer and brought-bring about their demiset hem to death. Moreover, humans do not have the right to ruin an animal's life for their own benefit. Since there are numerous methods for developing medicines and testing, using animals is not acceptable. For example, a software program can simulate the human immune system and a medicine effects on it without involving animals suffering. Furthermore, there are some institutions which try hard to defend animal rights and ban this invasive trend.

Considering all the facts above, it is rational to conclude that using animals in medicinal experiments can make them suffer and-also while there are more ethical methods to conduct researches, so-So this phenomenon is not acceptable as it is against their rights.
