

Some people use the internet to search for solutions to their medical problems. Is it a positive or negative development? Give your own opinion and examples from your experience.

There is a controversial question as to whether surfing the Internet in order to get remedies commensurate with our disease is an appropriate approach or not. I, for one, assert that using search engines is beneficial in terms of knowing more about illness, nor does finding medicine.

There are several factors in order to support this perspective. First and foremost, in today's technological world, people are used to searching on the Internet in every topic, and it leads to them acquiring today's wisdom, but distinguishing illness, people might endanger themselves by which I mean demonstrating the kind of a disease requires some tests which are merely done by doctors. A further well-known factor is that a major segment of medicines has side effects which doctors admittedly struggle with studying several years under consideration of mentors in order to learn them, therefore, it is not reasonable that patients simply google knowledge to attain.

Although receiving medical treatment on the Internet causes some drawbacks, the contribution of the internet when it comes to increasing information of sickness is undeniable. As a case in point, it must be said that people who are unfamiliar with herbal medicines could have remarkable access to this traditional knowledge by the Internet, and adding some vegetarian cuisine to their balanced diet when they have a notably minor ailment, or preventing to catch a disease.

In conclusion, from my point of view, it is inadvisable that individuals surfing the Internet to achieve medical treatment without assisting doctors in demonstrating their disease. Yet, it could be useful to accomplish data about their illness.
