**Topic:**

**The international community must act immediately to ensure that all countries reduce their consumption of fossil fuels as gas, oil, and coal.**

**To what extent do you agree or disagree with this statement?**

**Give your own opinion.**

The worldly ubiquity of burning fossil fuels has been really hazardous. Therefore, some officials insist on the notion that stringent measures should be taken to decrease the amount of this consumption in all countries by some internationally prestigious councils. I personally presume that these preventive rules should be enforced by these organizations as soon as possible lest we are putting the future of our planet at risk more.

It is universally accepted that the more the non-renewable energies be utilized by factories and vehicles, the more the greenhouse gases are produced. These gases have led to global warming, the most important negative ecological phenomenon that humankind have experienced since the industrial revolution. This causes not only deforestation but also melting polar ice, hence deterioration of natural habitat. Moreover, a huge amount of carbon dioxide contaminates the conurbations thereby endangering the healthiness of all kinds of creatures, so we are experienced some incurable diseases among humans such as cancers. However, governments for reaching more economic growth heed neither advice nor warning of the environmentalists. Therefore, relentless pressure by international communities should be more to avoid damaging the ecosystem more.

On the other hand, although an amount of fossil fuels consumption of developed countries and those of their developing counterparts are not comparable, the devastating effects of this limitation on the economy of the latter are more. Consequently, it is not justified that all countries be assessed based on the same laws.

In conclusion, for the above-mentioned reasons, I assert that internationally civic activities can really assist in decreasing the fossil fuels usage, the phenomenon with irredeemable deleterious consequences.
