

Increasing the price of petrol is the best way to solve growing traffic and pollution problems.

To what extent do you agree or disagree with the above statement?

What other measures do you think might be effective?

In this day and age, air pollution and traffic congestion have become serious problems especially in big cities. One of the main grass-roots of these concerns is related to the source of energy like petrol. Some individuals believe that ~~augment-increase in~~of the price of petrol ~~in-is~~ the best solution to conquer aforementioned anxieties. My firm conviction is that other ways except increasing price of petrol could have positive effects on mentioned problems. I will discuss my solutions to tackle this issue.

In my estimation, increasing the price of petrol is a short term remedy. Most of personal and commercial vehicles besides tremendous factories need petrol and other kind of oil products to operate. For instance, in my country, Iran, The government had decided to increase gasoline and diesel petrol prices ten years ago but this decision had a low influence ~~to-on~~ traffic jams and air pollution because all of the people need their cars and they ~~had-are~~ forced to pay extra price. Another aspect of this remedy is related to the price of other goods and materials. It has domino impacts to increase the price of essential foods because of increasing transportation cost.

The major responsibility of this matter is related to the government. ~~Now-a-day~~nowadays, all the car factories ~~have-tried~~trying to ~~product-produce~~eco-friendly vehicles based on renewable sources of energy like electricity or Hydrogen to produce less emission in comparison with petrol vehicles. The government should perform strict ~~laws-laws~~ for using conventional vehicles and encourage people to use hybrid, electrical and fuel cell automobiles. Last but not least, it must ~~performed-impose/introduce~~ huge tax and other restrictions to enter vehicles into the city center or put it on the amount of pollution that each vehicles ~~product-produces~~.

To put it in the nutshell, all individuals have-are responsible to our environment and planet. By respecting ~~to~~-worldwide rules and reducing ~~of~~ petrol sources, we can hope our planet will be savedd for upcoming generations.
