

Increasing the price of petrol is the best way to solve growing traffic and pollution problems.

To what extent do you agree or disagree?

What other measures do you think might be effective?

Nowadays, traffic and pollution problems have been considered by governors, in particular, in a metropolitan and it is suggested to control it by increasing the cost of petrol. Although it could have an effect on decreasing them, I believe, only if we make it culture, can we expect such these problems to be solved. This essay has been written in order to put forward some solutions to reduce traffic and pollution problems.

First and foremost, the reason why ~~the existence of such~~ these problems ~~exist is are~~ related to lack of an equally suitable public transportation which causes to be reached the conclusion that people use their own cars. Furthermore, with rising the number of public transportations such as metros or buses, not only are people enticed to use them due to being cheaper, but for its acceleration and comfort.

Moreover, If I want to give an explanation (had it seen) beyond the scope of this essay, I will offer a suggestion that increasing the price which causes some problems such as economic problems or falling the value of money, never was a wise solution according to which has been seen in the whole history.

In sum, by increasing the price of petrol neither traffic nor pollution problems will be solved and I purely disagree with them. I assume, growing public transportation and producing cars working with electricity can help to ~~decline~~ ameliorate those problems. As is seen, in recent decades, in developed countries by superseding hybrid and electric cars instead of gasoline and petrol cars the pollution production rates have been dropped gradually, so it is a fairly more acceptable solution rather than increasing the price of ~~patrol~~ petrol.
