

Nowadays the amounts of rubbish are constantly increasing in many countries of the world. Why is it happening? How can it be controlled and eventually reduced?

During the last five decades, the amount of waste material produced by people have become a critical problem in many parts of the world. This controversial issue is now threatening life on our planet in a way that scientists are working hard to find a sustainable solution to manage this ever-increasing production of garbage by humans. This essay elaborates on the reasons behind this problem, along with a few simple solutions to reduce the amount of rubbish production.

The first and perhaps the most significant point in this issue lies in the fact that people are consuming more commodities than before. Tired of hectic pace of life, people from all walks of life especially in the industrial countries are using disposable materials to compensate their time limitation. What makes this matter worse is the remaining parts of non-recyclable electronic devices and petroleum products such as polymeric materials. Although scientist are trying to find a permanent solution for such materials, regrettably they have not succeed in finding a reliable solution.

Fortunately, nowadays an overwhelming majority of people are aware of the harmful effects of production of this much of waste. That people's awareness play a significant role in reduction of garbage is an indisputable fact. Thanks to the Internet and social media these days in different parts of the world an acceptable portion of the population are dividing their waste into two main categories to pave the way for the recycle procedure. Only when the authorities provide families with appropriate materials and introduce proper laws, can they expect ordinary people to reduce their waste.

By way of conclusion, I reaffirm that had we known about the consequences of this issue, we could have prevented it earlier. However, I still maintain the idea that addressing this problem requires collective wisdom besides group cooperation of every concerned individual around the globe.
